

Reveal AI: Demo Plan

Companion to PRD v0.3

Version: 2

Author: Ahmed Sheikh

Date: 5 August 2026

Delivery: 26 August 2026

How this works

Six themes. Six demos across three weeks. Each one is a working piece of the product you can click, not a status update.

Every demo is under 10 minutes. You see it, you react, and if something is wrong we catch it while it is still cheap to change.

The themes are ordered by risk, not by how impressive they look. The hardest technical problem gets demoed on day 8, ugly and unpolished, so that if it fails we have time to change approach instead of finding out in the last week.

Every demo maps to numbered requirements in PRD v0.3. Nothing gets demoed that is not in the PRD, and

nothing in the PRD ships without being demoed.

Theme A: The data actually saves

Demo 1. Thursday 6 August, day 2.

Covers: T-1, T-4

This is the problem you reported first, so it gets fixed first.

What you will see: I type a message in the chat, close the browser completely, reopen it, and the message is still there. I will also show session records appearing in the database as they are created.

Why it matters: everything else sits on top of this. Until it works, nothing else can be trusted.

What I will tell you: whether the bug was a simple fix or a structural problem. If it is structural, the three-week date is at risk and you hear that on day 2 rather than in week 3.

Theme B: Chat that remembers you

Demo 2. Tuesday 11 August, day 5.

Covers: T-2, T-3

The single most convincing thing in this build.

What you will see: two chats side by side, same user message. One is the current behaviour, generic and cold. The other has the user's last five check-ins loaded, and it opens by referencing that their mood has been dropping since last Tuesday.

The difference is obvious in about four seconds.

Decision I need at this demo: how much history is the right amount. Five sessions is my starting point. Too little and it feels shallow. Too much and it starts bringing up things the user has moved on from, which reads as intrusive rather than caring.

Theme C: History you can see

Demo 3. Thursday 13 August, day 7.

Covers: T-5, T-6, T-7, T-8

What you will see: the Profile History screen. Past sessions with dates, moods, and summaries. A chart of mood over time. Loading tested against an account with 100 sessions.

I will also demo crisis handling here, because it lives in the same feature. I will send test messages containing self-harm signals and show you that the normal conversational flow stops and support resources come up instead.

That second part is not a nice demo to sit through. It is the one I would most want you to actually watch, because it is the difference between a wellbeing product and a liability.

Theme D: Knowing who is talking

Demo 4. Friday 14 August, day 8. This one will look rough on purpose.

Covers: I-1, I-4

No interface. Just raw output on screen.

What you will see: I play a real recording of two people talking. Next to it, a transcript where every line is labelled with who said it, matched against my enrolled voice sample. Then I play a second recording made somewhere noisy, and we look at how much worse it gets.

This is the highest-risk item in the project. Demoing it early and ugly is deliberate. If accuracy is not there, we find out on day 8 with a week and a half left, and the options are narrowing the supported scenarios or moving the date. Either way you hear it from me with time to decide.

If it works, everything after this is assembly.

Theme E: What the conversation meant

Demo 5. Thursday 20 August, day 12.

Covers: I-2, I-3, I-5, I-6

What you will see: the full Intent Detector flow, start to finish. Consent screen, scenario picker, record, upload, wait, result. Then logging out and back in to confirm the result is still there.

I will run the same recording through twice in front of you. That is not padding. It shows how stable the output actually is between runs, and it is the clearest way to settle D-1, the percentages versus observations question.

If the two runs come back with meaningfully different numbers, that is your answer on which format to ship.

Theme F: What happens when it goes wrong

Demo 6. Tuesday 25 August, day 14.

Covers: I-7, N-1, N-2, N-3, N-4

The least exciting demo and the one that decides whether this survives real users.

What you will see: a recording too noisy to read, showing the quality warning instead of a fake result. An upload interrupted mid-transfer, recovering without losing the audio. A user deleting their voice sample and recordings, with the files confirmed gone from storage rather than just hidden. Stored audio confirmed encrypted. A 20-minute recording timed end to end against the 3-minute limit.

Delivery is the next day, 26 August.

Schedule at a glance

Demo	Day	Date	Theme	Requirements
1	2	Thu 6 Aug	Data saves	T-1, T-4
2	5	Tue 11 Aug	Chat with memory	T-2, T-3
3	7	Thu 13 Aug	History and crisis handling	T-5, T-6, T-7, T-8
4	8	Fri 14	Speaker identification,	I-1, I-4

Demo	Day	Date	Theme	Requirements
		Aug	rough	
5	12	Thu 20 Aug	Full Intent Detector	I-2, I-3, I-5, I-6
6	14	Tue 25 Aug	Failure states and data handling	I-7, N-1, N-2, N-3, N-4

Every requirement in PRD v0.3 appears exactly once in this table.

Six calls across three weeks, roughly two a week, none longer than 10 minutes.

Ground rules

Demos are for feedback on what exists. Not for adding new things. If something new comes up during a demo I will note it and price it separately rather than absorbing it and going late.

I will always show you one thing that does not work yet. Every demo. A limitation, a rough edge, something incomplete. A demo where everything is perfect is a demo where something is being hidden.

Scope freezes on 12 August. After that, changes move the delivery date and I will tell you by how much before agreeing to them.

If a demo slips, you get told the day before, not the day of.
